1. **Create search people and jobs component.**

    Initially, a component called search was created in the page folder of the application, this component will contain the components of navbar, search-person-or-job and search-footer-filter.

2. **Navbar component creation**

    Once the component was created, the next thing was to make the design based on the mockup made.

3. **Search-person-or-job and search-footer-filter components creation**

    Once the two components were created, the respective design began to be made based on the mockup, as well as the creation of the corresponding path for this module, which was determined to be 'search'.

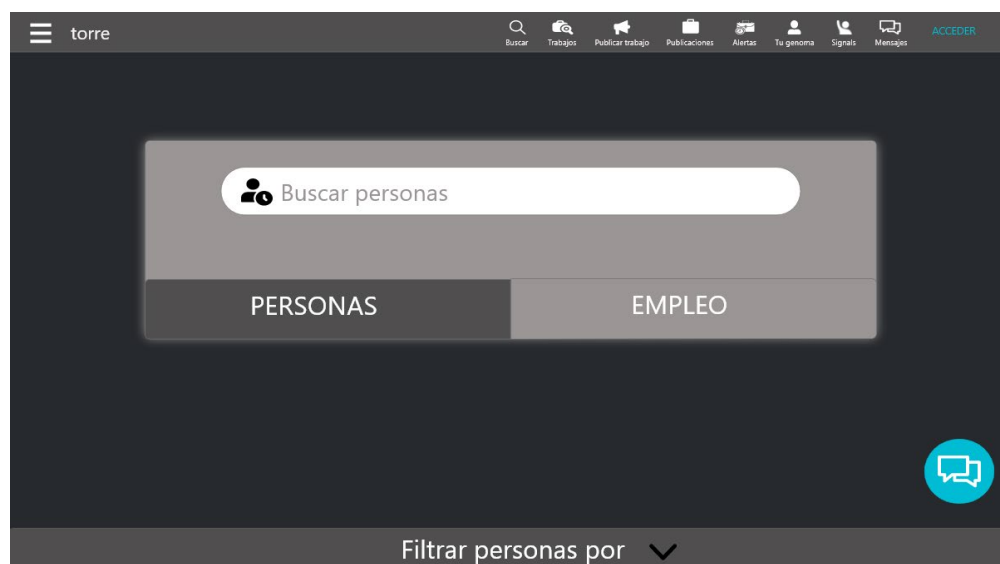

Figure 1 Mockup search

4. **Functionality implementation in Search-person-or-job component.**

    Once the design was advanced. The logic that this component will carry began to be implemented, for that reason the first interactions began with the queries and the data provided by the API.
